

List your research objectives.

The primary aim of the proposed research is to measure the psychological and social impact of LPint. We will look at GBV reduction and its consequences for the targeted men, their wives/partners, their children and their communities. Our secondary aim assesses whether this change in behavior (i.e. reduced GBV) is mediated or moderated by a reduction in symptoms of post-traumatic stress disorder (PTSD) or other psychopathological conditions.

Summarize your method into one to two sentences.

The first aim will be addressed by employing standard Randomized Controlled Trial methodology, using standardized tools related to GBV and other variables of interest, at baseline, post-intervention, and one-year post intervention (sample 800 men + 800 women per round). In addition, we will use standardized scales of PTSD and other psychopathological conditions to test whether they mediate or moderate the reduction of GBV. Finally, to contextualize our findings, we will use qualitative research to understand cultural idioms of distress and cultural explanation models.

**The deadline for application: 25<sup>th</sup> May 2018.**

Dates of interview: to be communicated

**Successful applicants will be notified on 31<sup>th</sup> May 2018.**
